Part 1: Iterations

Question 1 - Creating For and While loops (using large_vector data set)

1A. Use a while loop to assign a new variable, mean_while, as the mean of large_vector. Use print to display this value.

```
## [1] 7.900514
```

1B. Use a for loop to assign a new variable, mean_for, as the mean of large_vector. Use print to display this value.

```
## [1] 7.900514
```

```
## [1] 2461837
```

1C. How are these methods similar and how might vectorized functions be superior?

These two loops, for and while, using similar methods but with different count validation statements at the top of each loop. Where the for loop uses (i in count:countLim) for iteration checks and the while loop uses (count <= countLim) to validate the loop count.

One example of how vector functions are superior are how they can be mathematically manipulate large amounts of elements within the vector. For example, the vector "large_vector" holds 2,461,837 elements or numbers. A simple for/while loop is able to quickly run a summation of each vector element and find isn't mean.

Question 2 - Loops vs vectorized functions

uses the large_vector data set.

For Question 2, parts A and B, we will normalize each element in large_vector by the total sum of large_vector using for loops and the vectorized function mean. Algorithms for each method should be encapsulated within tic and toc to compare computation time as shown in the example below: After tic and toc encapsulation to show computation times for each method, show that the normalization was done correctly by summing each element in the normalized vector (they should equal one after normalization).

```
## Warning: package 'tictoc' was built under R version 4.4.3
```

```
## 3.03 sec elapsed
```

2A. Use vectorized functions to assign a new variable, norm_vectorized, using the normalization described in the question stem. For this question, it is permissible to use vectorized functions to verify that the normalization was done correctly.

```
## 0.04 sec elapsed
```

2B. Use a for loop to assign a new variable, norm_loop, using the normalization described in the question stem. For this question, it IS NOT permissible to use vectorized function to calculate total sum (use a for loop).

0.2 sec elapsed

2C. Please explain the differences between these methods in terms of implementation, readability, and computation time. Using your own experiences in the workplace (or speculation of experiences for a job you would like to have), how might these differences be significant and what impact would they have?

Question 3 - Apply vs loops use the large_list data set. Vectorized functions are allowed in this question. Algorithms for each method should be encapsulated within tic and toc to compare computation time. After tic and toc encapsulation to show computation times for each method, print the contents of each newly assigned list.

3A. Use apply to assign a new variable, mean_list_apply, the mean of each vector in large_list.

```
##      [1]      0      0      0      0      0      0      0      0      0      0      0      0      0      0      0

3B. Use for loop to assign a new variable, `mean_list_for`, the mean of each vector in `large_list`.

3C. Please explain the differences between these methods in terms of implementation, readability, and computation time. Were these differences surprising? How do you predict these differences will change if we used lists with much more elements (i.e. `length(list) > 1000`)?

Part 1: Control

Controlling flow is important for manipulating data based on their values. We show how easy R makes control and iteration by comparing the Un-R way with the R way. The Un-R way uses for loops and if/else statements while the R way uses proper subsetting and vectorization. Let's explore these differences. use the `large_vector` data set.

Question 4 - Doing it the Un-R way

4A. Use the Un-R way, with a for loop and if/else statements, to assign a new variable, `nbr_zeros_loop`, as the number of zeros that are in `large_vector`. Print the value of this variable.

4B. Use the Un-R way, with a for loop and if/else statements, to assign a new variable, `smaller_vector_loop`, as all the values of `large_vector` that are not equal to zero. Vectorized functions (i.e. `na.omit`) are permitted but a for loop must be used to iterate through vector. Show that the sum of `nbr_zeros_loop` and the length of `smaller_vector_loop` are equal to the length of `large_vector`.

Question 5 - Doing it the R-way use the `large_vector` data set.

5A. Use the R way, proper subsetting and vectorized functions, to assign a new variable, `nbr_zeros`, as the number of zeros that are in `large_vector`. Print this variable. Show that `nbr_zeros` and `nbr_zeros_loop` are equal.

5B. Use the R way, proper subsetting and vectorized functions, to assign a new variable, `smaller_vector`, as all the values of `large_vector` that are not equal to zero. Show that the sum of `nbr_zeros` and the length of `smaller_vector` are equal to the length of `larger_vector`.
